Docket No.: 13768.1416
U.S. Patent Application Serial No.: 10/790,522
Filed on March 01, 2004
Examiner: Van H. Nguyen

1. (Currently Amended) A system that facilitates a performance enhancement in message-based computing, comprising one or more computing devices configured with:

a performance-based event transmission interface across which a request from a source is transmitted to a destination; and

a filter component in communication with the destination that dynamically determines which response information is irrelevant in order to filter out any excess response information that is deemed irrelevant, such that allows only one or more relevant responses from the destination to transition are transmitted the interface to the source via the event transmission interface, wherein the filter component is part of at least one of native code and managed code and wherein irrelevant responses are discarded;

wherein the source notifies a native layer that an event handler has attached or detached.
